

Corona News A story of promises: Vaccinations 05/28/2021

We still remember 2020: At that time, all the experts were talking about the fact that when it comes to vaccines it can take years before one can even be available. And that would be the linchpin of the pandemic. In order to dampen hopes, the long development figures were mixed with values about how many non-working vaccines, namely up to 500, were developed for other viral diseases that would then have turned out to be ineffective. Until the end of the summer the story of a long development and waiting time held out, every now and then the year 2021 was thrown in as an unlikely possibility of getting a vaccine, but that was it. And suddenly: Not the miracle of Kern, but the miracle of Biontech / Pfizer: In late autumn, suddenly the news that a success in vaccine matters was brewing, well, after 300 million euros in research grant for a company that was previously rather in the basement acted and presented bad numbers, the breakthrough brought the owner millionaire status to this day. And the Federal Cross of Merit, because he used the money so bravely for vaccine research. At the end of December, after Christmas, the time has come: Spahn announces: From December 27th at midnight the vaccination will be back.

But in the early days it doesn't work as it did weeks and days ago: The EU has negotiated the vaccine and instead of ordering generously and quickly has waited and wasted money on other projects instead of relying on vaccination. This is taking its toll and the whole thing only gradually starts to move a little faster from the beginning of February, because two other vaccine suppliers, Moderna and AstraZeneca, have joined and fully joined the company. But only briefly. After Spahn tried to distract from the already existing side effects with his speeches about vaccination reactions, it soon emerges that the problems at AstraZeneca are so great that this is only stopped, but is released again after a short vaccination freeze of 3 days the vaccine in abundance, side effects don't count.

But the drama chapter AstraZeneca is now open. The manufacturer also recognizes this and wants to rename the vaccine according to type: Haider is now Zwix. But it doesn't really work either, because the side effects not only remain, but new ones become known, then the vaccine is only recommended for younger people and then only for older people. No more information from Moderna. But from Biontech, it has meanwhile become a sure-fire success. And Spahn's recommendations: Maximum vaccination interval between vaccinations, i.e. up to 12 weeks, so that as many as possible can receive the vaccine first. There is also a list of priorities drawn up by STIKO, which the federal government changed after a few days and so confused after a few weeks that many, regardless of age, no longer know which column they are in: some professional groups have disappeared, others have been added, and migrants, asylum seekers and the like cannot actually be found as a group, unless one understands the federal government's encryption code, which means: residents in communal accommodation, under level 3, age 70+. Then why not in plain text? At this point in time, however, no knowledge or information has leaked out that this group of people in particular produces a particularly large number of infected people and is also ahead when it comes to occupying the intensive care beds. If you couldn't keep your mouth shut, nobody should know that. As soon as it is out, the protective assurances of the refugee understanders come: They can't do anything, don't understand the whole thing, don't trust the whole thing, don't know where to go. Funny, this group is the best cared for in Germany.

But back to Spahn: After he wanted to know that the second vaccination period was extended to the maximum, the veto comes a few weeks later: No, the time must be reduced to the minimum so that as many people as possible receive the second vaccination so that they are immune to that Become a virus. Because this number has to go up quickly so that easing can come again at some point. The subject of herd immunity is not an issue at this time, as many virologists had rejected this project, 80% of the population would need 2 vaccinations.

But not with Spahn. Before he takes on the matter, he first has to struggle with the frequent lack of vaccine, his ongoing announcements burst like soap bubbles, but there comes the solution. You don't even need the same vaccine for the second vaccination, no matter, the main thing is, what goes in. And to make the citizens believe that, he still shoots afterwards: A mixture probably also offers more and higher protection against Corona. That this also increases the chance of a side effect or even more than one, damn it, always these little things. You don't have to point out everything.

From mid-April the poor health minister also has to deal with the spread of rumors and then facts, the vaccinations keep as promised or simply kept secret, not at all permanently. Worse still: We are talking about a refreshment in a year, then the first bad smells come up, it could well be that this year the refreshment has to be for the first ones. And according to the latest findings, the vaccination must be repeated at least every year as long as the virus exists. That's stupid, because the experts guarantee (again) that the virus will never go away. So we will also need the vaccinations to death. It stinks a lot. The information policy of the federal government and the experts involved. Uschi Glas or Günter Jauch won't help with a vaccination campaign that goes wrong if you're wearing a vaccine patch on the wrong arm because you haven't had a vaccination yourself. Sorry, a mistake by the photographer.

But think positively: We started vaccinating in December 2020, in a good 5 months we vaccinated around 15% completely, around 40% vaccinated once. Even if the ambitions were much higher, but if there is nothing there is nothing. Mister Spahn can't do anything about it. Everyone should get a vaccination offer by September. Hopefully this is not the same as with retail offers, which are sometimes sold out on the first day. There are supposed to be general practitioners who already have a large waiting list for vaccinations until September; allegedly. But if you call them about a vaccination appointment, you suddenly get an appointment in a week because of a cancellation - that's great. You skip the 4 month waiting list.

So how is the vaccination going on now? A clear answer: As before. The only difference is that the 2x vaccinated people, who can now romp around freely in all areas, and some without a mask, are not immune to Corona at all, and others who meet with them are not either. Against contagion. What now again? Always these people who say something like that. And always in slices. Today that comes out, tomorrow that, the day after tomorrow something else. So, yes, it's true, even completely vaccinated people are neither immune nor can they infect others or others. Only the course of the disease is so mild in the vaccinated that they no longer develop symptoms, for example. It's great - for the vaccinated. Because anyone who has stuck to all the rules for 15 months and therefore has not received a Corona is now the stupid. I don't know though. Judge for yourself.

So if you haven't been vaccinated, either because it's not your turn or you didn't want to, Spahn got a special offer: the so-called contagion offer. Wait a minute, I'll explain it in his own words: Everyone can decide whether they want to get the coronavirus at some point, and everyone will get it or want to be vaccinated. And so that actions follow his words, the group of those who have been vaccinated and recovered has now been publicly activated for all actions and movements. This is new in the Federal Republic of Germany: We are now making politics and rules for minorities, i.e. for the 15% double vaccinated, the other 85% - let them watch. We'll catch everyone sooner or later, that's the motto now. Wieler and Lauterbach talk about 80% vaccinations that are necessary to loosen up, damn, someone has done that before. And shortly everything will be free again. But from June 7th the prioritization will be history anyway and everyone can queue up in the morning who will get the news in the evening, sorry, the vaccine is over. Come again tomorrow. Wait a minute, don't worry, it used to be the same with bananas.

Now it's the turn of the children to vaccinate, a vaccine also works safely and well with children: from 12, from 16 when, actually? The vaccination spasm starts again: some want children to be vaccinated because of the schools, others reject it. And again the opinions differ: Even experts say that they do not want to have their children vaccinated at the moment. Children weren't always the carriers either, but then they were, then more, so nobody knows how children are classified. Everyone does it differently.

Finally, the best news: The AstraZeneca vaccine is said to be contaminated. There are too many proteins in it, which have a negative influence on the immune system and can also intensify existing inflammatory reactions. Everything points to a lack in quality control. And then the note: Most proteins should not have any negative effects on the vaccinated. MAY. For me this means: I have no idea whether this is negative. And that's exactly how it is. Pure speculation and guesswork, I can do that too. I am speculating or suspecting that the STIKO, EMA, the Paul Ehrlich Institute, whoever was involved in the approval of the vaccine, checked it as thoroughly as Spahn said at the time, that thoroughness comes before speed in Germany, has probably covered up the fact that the vaccine contains these proteins, or has not checked it thoroughly. Because this info is brand new and has never been named. The manufacturer reacted quickly that it was not possible to produce such pure vaccines. Sure, but it was considered necessary to explain that right at the beginning, nope, there was at least the chance that it wouldn't come out. Let's see when the next vaccine story comes on the table. I am happy for everyone who has used this vaccine voluntarily and advertised its safety. As some experts have already said: there are no long-term studies, the vaccinated are the test subjects. Congratulations. Some institutions and bodies are just no better than the vaccine they are reviewing.
